There's a thin line between likably old-fashioned and fuddy-duddy, and The Count of Monte Cristo ... never quite settles on either side."

The Rotten Tomatoes movie review dataset is a corpus of movie reviews used for sentiment analysis, originally collected by Pang and Lee [1]. In their work on sentiment treebanks, Socher et al. [2] used Amazon's Mechanical Turk to create fine-grained labels for all parsed phrases in the corpus. This competition presents a chance to benchmark your sentiment-analysis ideas on the Rotten Tomatoes dataset. You are asked to label phrases on a scale of five values: negative, somewhat negative, neutral, somewhat positive, positive. Obstacles like sentence negation, sarcasm,

Model Deployment: Live Demo

Conclusion: limitation and Improvement

- **Data binning and Data processing:** bin 0 into 1, bin 3 into 4, to make the data less imbalanced and applied SMOTE in preprocessing data.
- **Model comparison:** compared with other pre-training models
- **Fine tune parameter of networks**

Thank you!
